

STEEL FRAME

We manufacture and deliver modular supporting steel frames suitable for lightweight gypsum walls. The frames are fixed to the concrete ceiling or steel bearing construction of the cinema (in accordance with the specification of the building's structural engineer). The supporting frame has brackets to attach to the inner surface of the auditorium wall. Mounted on a lightweight wall, the modular steel frame provides a strong and stable structure which supports the projector lift. The supporting steel frame is individually designed for the fixing method available in each individual cinema.
